ABSTRACT

Respond to social needs and provide opportunities for people to acquire social experiences, he needs to have physical space station and Public space and capacity to respond to this aspect of human life in urban communities is and one of the ways to attract people to public green space. Nowadays they tend to create and design the physical development of cities and urban landscapes in healing the problems that have risen And co and city officials, a number of policies and strategies to create a healing space in the urban landscape, urban and human use of the space provide for improved In this study the effect of green space to attract people to certain locations such as parks and public spaces That green spaces are to be discussed. This approach is based on the study of data collection (library studies and related documents) is used the components, principles and paradigms associated with the topic briefly reviewed and analyzed by our analysis.

KEYWORDS: landscaping, attracting people, places particular choice.

1. INTRODUCTION

Cities as the focus of activity and life, in order to guarantee its sustainability choice but to accept the structure and function of natural systems are affected. More involved in the global effort to conserve the natural environment and biodiversity and protect ecosystems relatively long and unique animal and plant species are endangered And the nature of the work and life of humans, a small green space within the city and also has benefits for people with less attention. However, empirical evidence and computational times due to the quality of urban natural areas show The presence of natural areas and natural elements in urban areas of quality of life are important in many ways. Ecological functions of green spaces for social, psychological, and its important role in the urban fabric as body indispensable component cities play a vital role in their metabolism. Park may experience a reduction in stress, increase spirituality, forgiveness, life and provide the residents feel relaxed, comfortable lead-In fact, the increase in population and the increasing pollution of urban green spaces play a vital role Day by day more and more green space as a natural filter to reduce environmental pollution And ensuring the health of the individual and the relative area residents and the environment is relaxed and Increasing restlessness of modern urban life and culture "civil indifference" urbanization, leading to lower communication and social interaction of citizens with each other and ignoring the importance of public space for social interactions is bedded .So that today the urban villages, especially in metropolitan cities, in direct contact with the natural environment, or very little, or no (Nor berg, 1980:166).

So if the city, the cradle and rocking the cradle of man today who is more lush and green than normal and harmonious development of security and comfort that more and more human (Michael and kiazade 116:1386). It can be concluded that urban green space, urban open space is part of the Natural or artificial areas that are often covered by trees, shrubs, bushes, flowers, grass, and other plant-based monitoring and Of management with regard to the terms, rules and relevant expertise, to improve living conditions, habitat and welfare of citizens and non-rural population centers, maintenance or construction are (Nakhaemoghadam ,Sargazmalek, 199:1386).

The idea that urban green spaces can affect the behavior of the citizen to regulate In fact, such behavior is acceptable nowadays to be used, it is possible that the Planning and design of urban green spaces through a combination of such plans with the regulator, Provided moral and social development of individuals so that contact with nature can only provide compensation for damage identification and harmonious development of personality is (Choay, 1986:255).On the other hand, one of the criteria for assessing the environmental quality of the city's green spaces are public spaces in which citizens are able to interact and dialogue with pay for safety and comfort. Accordingly, we can say, as an urban landscape planning and projection, and the cursor location in the human virtues as the quality of green spaces can be effective in attracting people to the places they came from the paper it is desirable urban landscape works from three perspectives of sociology, cultural and psychological impact on certain places attract people to be investigated. Global approach to the social and psychological structure of green spaces: In the past, there was a picture of the limited open green spaces so that these spaces are limited to a narrow stream of water fountains and a garden plant and would (Crips, 1979: 11)). Framework and lack of comprehensive approach in this regard, was the subject of urban green spaces and open effects are rarely considered to be one of the mechanisms (Amir Yarahmadi, 1378: 116).

But the approach to urban green space has a wide range of spatial patterns. Other functions of urban green space in the urban metropolises of the country, Praknshhayy in shape spaces; So that it, in this spaces in countries with other function could social dynamics, cultural and psychological cause's citizens.Today, the approach to the green spaces in

European metropolises, and the integration of modern structures in this Mhythast nostalgic sense. Designing a green space, away from the purely physical, so that now they can work in this space as a place of social, cultural and psychological positive, the emphasis is (Madany pour, 1379: 88-46).Psychological and social impact on the citizens of urban landscape topics Become important applications in other countries, so that each year a large area of Urban land is devoted to this crucial work. For example, in Chile, every year 20 thousand hectares of land is under green because of its importance and impact on society and culture is desirable, sought to have (Shahrvidyan, 14:1383). It's an urban landscape in many countries as one of the main topics in the social and psychological dynamics of development and recognition of citizens in this century.

2. MATERIALS AND METHODS

In this paper is a descriptive and analytical method. Tools for data collection is library research, internet and field research and General pattern of the research process is based on material extracted from the literature and experience. After study predicted, Results will be analyzed and tried to use the processing and analysis of data and findings in the field of Library Studies, to achieve results in terms of proposals for better use of Green Space in attracting people to certain places.

3. Impact of Green Space in attracting people to a specific location choice

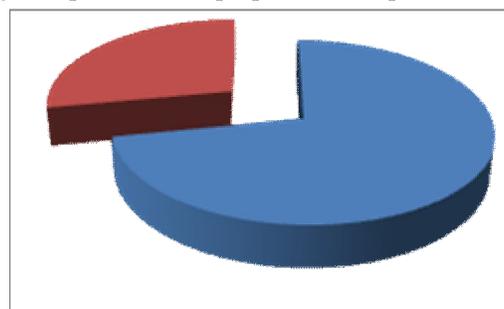

In today's age of technology and human-machine-human is one of the important requirements to achieve Quiet place with beautiful nature in place to be able to relax for a few hours so business days to over the weekend, obtain the or to the days of to relax for the stress of the family. The fact that the path of science makes progress through their need for more Of the public reveals the best places in the body that can This would eliminate the need for some form of public spaces are spaces that are shared by people from different social groups. The spaces where the exchange of ideas and information site for the formation of social networks Such spaces include a space before they have an experience (aL, 2001, Hajeret) The result of such interactions and experiences among different individuals and groups, to get a sense of collective identity,self-respect (self-esteem), social skills and community involvement will enhance the public spaces in relation to the interpretation of human social bubble of Aristotle's ever been and is regarded by planners and urban theorists (Douglas, 2003).Public spaces include a variety of urban spaces such as streets, parks, playgrounds, restaurants, and other forms Mullahs are gathering spaces.(Car: 1992, Lang: 1994 & Douglass: 2003)

The activities can be planned and designed to meet a specific activity that Consideration of green space for each of them to help them be more productive. To investigate this issue using a sample issue can be clarified According to the study, more than 100 people aged 10 to 70 years there are certain places on landscaping questions they were asked if there Green space in the restaurant area of this research was on the effects of green space they were asked to capture this place.

Tab1: Sex and the unique sample

Gender	number
Male	50
Female	50

Fig1: Chart of green space to attract people to certain places (inside the restaurant)

Blue: agree of green belt
Red: against of green belt

According to the survey, many people are seeking places with greenery and a Green space makes them willing to go to places they could be so green Contribute to the goals of elected positions.

**3. Impact of Green Space in attracting people to certain places
Impact on the value of residential properties in urban park - a place of choice (Housing)**

Today, one of the problems of urban life is the location of housing and living. Complications renovated property has long been regarded as a source of municipal revenue managers Income urban and municipal levels through Toll Collection renovated property Methods requires accurate and up-to-date with rising property prices, depending on various conditions, effects of modernization as well as rise. One of the major problems of

urban life, the best place to live and live (2010, Koohi MK) is one of the key elements of the market economy, stable, transparent and efficient land market. For this reason, the market value of land and property are extremely important. It is clear that the property market to grow varies depending on the type of property, for regional and even global terms (2008, Koohi MKHS). One of the issues that have an impact on residential property values were going up to the city park Can be expressed in a closed space is a manifestation of this statement in 1389, according to research by Kohei M. Kamali, Mohammad Ali Rajabi was. Effect of Aurora Parks and castles in the region salmon Yousef Abad Tehran, which handles Local scale, are classified as urban parks. The results showed that the Optimization model, approximately 18% of Aurora Park Trout Park and Fort enhance the value of residential property is 9%.

Average impact on the neighboring property to the Tehran YOSEF ABAD park area 5/13% of this may reflect the impact of green space to attract people Select a place to highlight some of the areas housing choice can be specific to each individual.

4. Influence the uptake of green space for children to play "Child Friendly City" case: Bam Child Friendly City - a place of choice (space game)

Child Friendly Cities project mainly to create opportunities for children in order to shape or change the surrounding environment. From the perspective of child-friendly designs for granting citizenship to the children develop the knowledge, enhancing community participation, reducing the amount of violence against children, according to the environmental issues. Bam in Iran (after the horrible earthquake in 1382) was the examples that were considered to be of child-friendly approach.

The projects identified in this regard, given the finding of green space Design Patterns Children view the comments feature kids play space on city projects Child Friendly Barn collected through a questionnaire is of particular importance Children can choose to absorb the impact of green space to play lighter. There is a major indicator of how green space can play games for children and attract them to choose the place of impact on society.

5. Impact of Green Space in attracting people to certain places

(Influence selection of green space for walking)

Today, advances in science and technology will lead to people relying on new technologies, new business practices will be any change in all aspects of the different effects. Personal, social, economic and ... Man created. But these factors are those that affect human health because of the special role has now passed.

Instead of replacing the epidemiology of non-communicable diseases communicable diseases, biological agents for the control of aberrant behavior on the one hand and the health and living Feeding practices on the other hand, the increase in non-communicable diseases, health care and the need for change in attitude towards the preservation and promotion of health requires And inactivity as a major cause of the spread of diseases in the world today The best and most natural walking exercise to gain fitness and mental activity And each day brings more people into the hike we were on the One of his investigation of the effect of attracting people to certain places and green spaces in which they choose to walk, we review the results of a Study on the sidewalks and green space that Tree was a good show That 85 percent of citizens who choose to walk this path alone were chosen because they are green because they are more responsible for the air conditioning.

6. Urban management and urban green spaces

Conceptual broad variety of urban management is improved, but the aggregation Explanations The city manager said the city management is an enterprise-wide system consists of formal and informal elements and parties involved in areas of effective Various social and economic fabric of urban life goals, managing, directing and controlling the development of sustainable cities (Javadi, 1381:47). Today, this system is facing many challenges, but the challenges of urban management can be said that the quality of life of citizens demanding that Inclusive society in all its aspects are dynamic economy, social justice, cultural diversity, yet robust, sustainable development and urban environment safe for all demands The general public. In fact, they call for a more open system of urban management, are comprehensive and effective. In fact, they call for a more open system of urban management, are comprehensive and effective. So you must create a balance between modernity and traditional and new approaches to deal with He challenges the entry and transition from traditional methods, today the world's urban management and urban development is essential to the

welfare of residents that are managed to provide its own. Today, the city administration has been widely important organizational role in the success of urban development plans and ... Has the responsibility (shahriavar, shiea 24:1380).

So to deal with the challenges of managing conflicts in areas such as green space, the city is compelled to reject their thinking and develop staff Has been developed and applied in order to be able to produce quantitative and qualitative factors more urban walk. Armed with logic-oriented city managers can Common principles and civic culture based on its shape, is oriented so that it's entire logic. Accordingly, we can say that the development of green spaces in urban areas are in need of dynamic management, this management is required prerequisites; These prerequisites are in place so that the chain is taking on yet another disturbing influence of affect (shaditalab, 196:1381).

7. Green space and its effects

The alienation of Genesis, one of the sources of the problems that plague the world today and it was all over, they will appear between people and the built environment (Hanna, 1958: 148); public green space while also providing insights environmental and urban leisure space and provide a platform for communication and social interaction, it is important to place it deserves. Therefore, the purpose of an urban green space, urban land surfaces with vegetation, manmade, which includes both the efficiency and effectiveness of social ecologists (sozanchi, 5:1383), so that urban green spaces as part of the Open Space a major factor in the city's urban landscape, ecological improvement, leisure and recreation are a way to increase the quality of the urban environment (Khalilian, adel, 854:1385).

On the other hand, one can say that the main objective in the design of green space, access to social and psychological effects on man and nature closer to each other. Although the function of green space in the city's physical and mental functioning, social and environmental outcomes that can be expected (Taghvai, 41:1382). Thus, one of the most important functions of green space, social function - it is mentally to achieve this function requires structural changes in the structure and space to think about the physical and social needs - mental health is urban. Social impacts resulting from the creation of a whole division of the city's green spaces will be provided as follows:

Sociological effects, Cultural effects, Psychological effects (mental and physical)

- With the presentation favored the introduction of urban landscape from the perspective of cultural sociology and psychology, the citizens pay.
- Favorable effects on social structures of urban green spaces, cultural....
- Sociological effects of the expansion of urban green space to the Citizen

A social relation in space and time occurs near the beginning of a social relationship, but not a sufficient condition and the degree of heterogeneity is necessary to maintain these relationships. Physical structure and functional divisions or space may be limited opportunities to communicate opener. (talebi, 161:1384). Green spaces as social spaces that induce a sense of place, to allow a person to learn from others, they create an opportunity to update their personal and social values, spiritual growth, enhance their overall green space to suppliers It gives them a sense of freedom and independence, so that such a thing is not possible in the home and workplace. Natural green spaces into urban environments and living spaces and rough texture the city built an artificial environment and a calming and comforting colors Eye-catching, ear-catching tones and clean air, the spirit is ready to deal with the difficulties of urban life (B. Sultan, 1381: 13-211). Green spaces and the natural environment on the relationship between community members have established strong (Ashrafi, 361:1377) It is essential for a society that wants to be sustainable.

Community and society as consisting of a number of people who live in certain places with specific geographical features. (Correct) But the city's population today is a social artifact or if citizens are associated with mechanical and routines accordingly.

In an environment where the Agent and the mechanical and upset this off, the green space (rahnamaee, 1382: 170-169) For example, the results of the survey also shows that 31 percent of the University Park citizens referred to Parks and gardens, the park factor for 28 percent of the park to its convenience and freedom (ie freedom) of the problems and tensions of urban life According to this study, the primary factor motivating the rest of the parks (25% of clients), then the sense of presence in nature (18%) and sports (16%) is charged (Mohammadi et al, 1386), so it works sociology landscaping on civilian stated as follows:

- 1 - To create a better social interaction among residents in urban areas (Saeednya 44:1379)
- 2 - Create new fields of business or employment;
- 3 - Acquisition and recognition of social factors (norms, values, subcultures, etc.)
- 4 - Social and implementation of new friends and people to fill the emptiness and loneliness (Engineering moshaveramooz, 1382:11)
- 5 - The number of non-governmental organizations (NGO's)
- 6 - Ideas worth spreading,
- 7 - Increase of feeling or interest
- 8 - Creating a favorable environment for recreation and leisure (Babapour, 1387:62)
- 9 - Other social effects (morale, character building, etc.).

7.1. Cultural impacts resulting from the expansion of urban green space to the Citizen:

Every phenomenon as an open system has a space that is interactive with the environment. Environmental influences on the system and the system itself equally affected. This process continues throughout the life of the system and will never stop. If the environment has an impact on the system. It will revolutionize the way in bringing the desired effect on the environment if the system fails to transform it into the desired shape. So in this respect to any system with its

environment, which is related to the interaction, the interaction effect, one may be dominant over the other, so green and citizens to act as an open system. The impact of green space on the promotion of culture and cultural activities of citizens is significant. Green space is an important cultural influence on people can include:

- 1 - Expanding urban culture and citizenship;
- 2 - Familiarity with national figures;
- 3 - To form associations, artistic, sporting, and cultural and ... NGO or other organizations in the community such as environmentalists...;
- 4 - Organizing training courses, research, festival, night, poem, painting competition for children and ... Green spaces;
- 5 - Publishing attitudes and values (cultural values, subcultures, etc.);
- 6 - Other cultural consequences (progressive culture, infrastructure and urban cultures of dating immigrants ...).

7.2. Psychological effects (mental and physical) and expand green space on citizens:

Impact of landscape and green space to emotional health and in recent decades it has been expanded and different theories, including improved stress Ulrich believes the landscape, the potential tends to reduce their stress levels, while the built landscape version the actual stress block does not improve, but they can cause stress (Ulrich, 2002). Basically green space right in the city, in addition to physical health, peace of mind, greater work efficiency and quality of life is superior (Ebrahimzadeh, Ebadijokandal, 39:1387).

But while many of our cities, the lack of attention to the human aspects of urban design and architecture that make the cities more than rural mental health community is vulnerable. But while many of our cities, the lack of attention to the human aspects of urban design and architecture that make the cities more than rural mental health community is vulnerable. So, how to build and shape the green spaces can have direct effects on the mental health clients, Research shows that The perspective view the natural landscape is an important part of healing purposes and do not necessarily operate in the natural landscape and green space. (Kaplan 1992:125-133). Important role in the promotion of green spaces and especially mental health - Mental citizens can study as noted below: Van den Berg Studies show that trees and forest landscapes such as parks, reduce stress, enjoy the view, reduce anxiety and increase focus on the role of (Van den berg, 2003:125-146). Reviews of Fuji, Nakamura and, there are a significant impact Hedge relaxation and tranquility of human society (Nakamura and Fuji, 1992: 139-144). Studies show that Luman Park with direct graphical effects of plant species and the rest of the citizens (Luman, 2001: 31-44). To see the effects of trees and other natural resources, such as reducing stress, getting fit, reducing blood pressure, reduce anger and aggressiveness and increase the positive impact of the results that it achieves Harting (Harting, 2003: 109-123). Reviews and Grahn Ottoson that old garden variety of fruit trees and flowers, the concentration increases (Ottoson and Grahn, 2005: 23-55). Results of a survey showed that the development of urban green spaces in the city of Sistine by changing the microclimate cooling to reduce the temperature and air their own citizens, enhancing comfort levels (Moghaddam et Nakhaee, 198:1386-204). Mental relaxation: the effects of mental relaxation on the nature and position of the watch is made of green space, the science can produce a fitonesid it is pointed. Trees such as walnut, pine and ... Of a substance called "fitonesid" floated that the effect of these substances on humans is fun; So that the balance between the two hemispheres of the brain are well established and provide normal and sedation is given to humans (Alizadeh, 10:1381-9).

Positive effects on the physical health of people: People in industrialized societies are very few sports for many physical activities do not have a place; the results for the physical activity should be encouraged to do more of them. Attractive areas of green space can encourage people to participate in such activities. Of such studies suggests that green spaces as places for recreational activities is preferred locations made (Group D 11:1382) rajerolrikh example, in a study on the psychological effects of trees and green space on the patient's hospital course was Came to the conclusion that green space can shorten the period of hospitalization (majnonian, 213:1374). Improve the effectiveness and efficiency of performance (higher productivity) live in urban areas in general in modern life has led to the mechanical and has little leisure for people with little spare time to do it, not going to take long trips and multi-day life of the program will be. So little time to make optimal use of opportunities for work and everyday life is And the best place to do this is urban green space; Because the position of these spaces, increasing motivation to live.

Solve challenges and dilemmas of people through the exchange of ideas, friendly advice and ... Centers based on formal and informal green space;

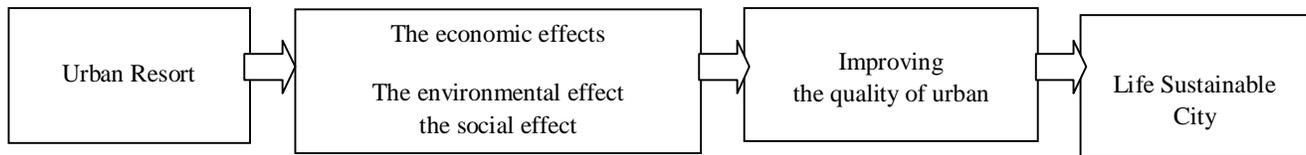

8. Impact on human behavior and mental processes and behavioral dynamics;

Staying in good physical and mental condition of the continued presence of green spaces such as exercise, sports, and ... In these spaces;

Green space and its role in sustainable cities

Human environment, comprehensive notion of society affect of external factors and their inter relationship that cause biological balance. So how the human relationship with the environment, to communicate and influence people's emotional and psychological impact on the quality of ecosystem characteristics are important and undeniable. (Lokoboziye) for urban green spaces, and place great importance on the belief that urban space of ten units for occupancy units must not be green space.

The concept of urban green space, which becomes even more important when we consider the urban land, is directly related to urban sustainability. After today's new stable and unstable heterogeneous urban cities, social sustainability is that the park is equitable participatory citizen interaction (Mohammadi et al., 97:1386).

Sustainable urban form and urban promenade, victim and reference Tim rid 48:1388 quoted Chiesura, 2004:136

Conclusions

In this paper, the impact of green spaces attract people to certain locations that are chosen are investigated And the calculation results showed that the percentage of green space in people who are used to select the desired location Is relatively high and the amount of green space in areas of daily life is somehow more urgent. Green spaces in cities since regardless of the outcome of ecological, social and psychological implications and effects are desirable in many areas. One of the problems in the machinery of human life and diseases caused by physical inactivity is Walking is one of the ways to combat it by examining a sample survey Choice of green space in place for approximately 85 percent hike on one The sidewalks of urban green space was Similarly, the selection of green space and rising housing prices in the Tehran neighborhoods were increased by 18 and 9 percent of the land was Finally, in recent years, population growth and urbanization, the lack of green space in City by city managers have increased slightly compared to the qualitative aspects of Green spaces in cities can act as the selection of a very Be effective.
